

Amendments to the Specification

Amend paragraph [0035] as follows:

[0035] Resistivity was calculated according to the formula:

~~Sheet resistance (ohms/square) x thickness (cm)/100 = resistivity (μohm·cm)~~

Sheet resistance (ohms/square) x thickness (cm)/100 = resistivity (μohm·cm)

Sheet resistance was measured using a four point probe resistance tool. For a 322 Angstroms thick film, the resistivity was 827 microohm·cm. A thinner film typically had a higher resistivity. For example, a 165 Angstroms film had a resistivity of 1316 microohm·cm.
